

## Work Sheet 7

Neil Francis N. Navarro

2022-12-12

### ***1. Create a data frame for the table below***

```
Student <- seq(1:10)
PreTest <- c(55,54,47,57,51,61,57,54,63,58)
PostTest <- c(61,60,56,63,56,63,59,56,62,61)
```

```
num1 <- data.frame(Student,PreTest,PostTest)
num1
```

##	Student	PreTest	PostTest
## 1	1	55	61
## 2	2	54	60
## 3	3	47	56
## 4	4	57	63
## 5	5	51	56
## 6	6	61	63
## 7	7	57	59
## 8	8	54	56
## 9	9	63	62
## 10	10	58	61

### ***a. Compute the descriptive statistics using different packages (Hmisc and pastecs).***

**Write the codes and its result.**

```
library(Hmisc)

## Warning: package 'Hmisc' was built under R version 4.2.2

```

**2. The Department of Agriculture was studying the effects of several levels of fertilizer on the growth of a plant. For some analyses, it might be useful to convert the fertilizer levels to an ordered factor.**

- The data were 10,10,10, 20,20,50,10,20,10,50,20,50,20,10.

```
num2 <- c(10,10,10,20,20,50,10,
          20,10,50,20,50,20,10)
num2

## [1] 10 10 10 20 20 50 10 20 10 50 20 50 20 10
```

**a. Write the codes and describe the result.**

```
num2factor <- factor(num2, ordered = TRUE)
num2factor

## [1] 10 10 10 20 20 50 10 20 10 50 20 50 20 10
## Levels: 10 < 20 < 50
```

**3. Abdul Hassan, president of Floor Coverings Unlimited, has asked you to study the exercise levels undertaken by 10 num3 were "l", "n", "n", "i", "l", "l", "n", "n", "i", "l"; n=none, l=light, i=intense**

```
num3 <- c("l","n","n","i","l","l","n","n","i","l")
```

**a. What is the best way to represent this in R?**

*Factor*

```
factor(num3, levels = c("n", "l", "i"))
```

```
## [1] l n n i l l n n i l  
## Levels: n l i
```

**4. Sample of 30 tax accountants from all the states and territories of Australia and their individual state of origin is specified by a character vector of state mnemonics as:**

```
state <- c("tas", "sa", "qld", "nsw", "nsw", "nt", "wa", "wa", "qld",  
          "vic", "nsw", "vic", "qld", "qld", "sa", "tas", "sa", "nt",  
          "wa", "vic", "qld", "nsw", "nsw", "wa", "sa", "act", "nsw",  
          "vic", "vic", "act")
```

**a. Apply the factor function and factor level. Describe the results.**

*factor function and factor level*

```
num4a <- factor(state)  
num4a  
  
## [1] tas sa qld nsw nsw nt wa wa qld vic nsw vic qld qld sa tas sa  
nt wa  
## [20] vic qld nsw nsw wa sa act nsw vic vic act  
## Levels: act nsw nt qld sa tas vic wa
```

**The result shows the levels of the states of the given data.**

*Getting factor level of states*

**5. From #4 - continuation:**

**Suppose we have the incomes of the same tax accountants in another vector (in suitably large units of money)**

```
incomes <- c(60, 49, 40, 61, 64, 60, 59, 54,  
            62, 69, 70, 42, 56, 61, 61, 61, 58, 51, 48,  
            65, 49, 49, 41, 48, 52, 46, 59, 46, 58, 43)
```

**a. Calculate the sample mean income for each state we can now use the special function `tapply()`:**

```
num5a <- tapply(incomes, state, mean)  
num5a  
  
##      act      nsw      nt      qld      sa      tas      vic      wa  
## 44.50000 57.33333 55.50000 53.60000 55.00000 60.50000 56.00000 52.25000
```

**b. Copy the results and interpret.**

```
num5a  
  
##      act      nsw      nt      qld      sa      tas      vic      wa  
## 44.50000 57.33333 55.50000 53.60000 55.00000 60.50000 56.00000 52.25000
```

*The result show the level and means of the income of each states.*

### **6. Calculate the standard errors of the state income means (refer again to number 3)**

#### **a. What is the standard error? Write the codes.**

```
num6.n <- length(num5a)
num6.sd <- sd(num5a)
num6.se <- num6.sd/sqrt(num6.n)
num6.se

## [1] 1.653911
```

#### **b. Interpret the result.**

*This is how I get the state income means by dividing the sd() to sqrt() or length() and that is how I get the standard errors of the state income means and this was the result.*

### **7. Use the titanic dataset.**

```
data(Titanic)
Titanic <- data.frame(Titanic)
```

#### **a. subset the titanic dataset of those who survived and not survived. Show the codes and its result.**

##### **Survived**

```
survive <- subset(Titanic, Survived == "Yes")
survive
```

```
##   Class   Sex  Age Survived Freq
## 17   1st  Male Child     Yes    5
## 18   2nd  Male Child     Yes   11
## 19   3rd  Male Child     Yes   13

```

*There 17 respondents who are malignant. And there are total of 49 respondent.*

*Getting the percentage*

```
18 / 49 * 100
```

```
## [1] 36.73469
```

**There are 36.73469 or 37% of respondents who are malignant.**

**9. Export the data abalone to the Microsoft excel file. Copy the codes.**
